SUMMARY

Computer Science student graduating May 2027 who bridges technical and business stakeholders, translating requirements from leadership and industry sponsors into working architectures and presenting the results in clear, non-technical terms. Hands-on with Python, FastAPI, PostgreSQL, Redis, and Docker on AWS (EC2, S3, IAM), and currently pursuing the AWS Certified Solutions Architect, Associate certification.

EDUCATION

University of Texas at Dallas

B.S. in Computer Science, GPA: 3.5

Expected May 2027

Richardson, TX

Relevant Coursework: Algorithms, Machine Learning, Artificial Intelligence, Computational Methods for Data Science, Operating Systems

AWS Certified Solutions Architect, Associate

In Progress

TECHNICAL SKILLS

Languages: Python, C++, Java, JavaScript, TypeScript, SQL

Backend & Databases: FastAPI, Flask, REST APIs, GraphQL, gRPC, PostgreSQL, MySQL, Redis, Docker, GitHub Actions

Cloud: AWS (EC2, S3, IAM)

ML/CV: OpenCV, MediaPipe, TensorFlow, PyTorch, scikit-learn, Pandas, NumPy, Matplotlib, Seaborn

Developer Tools: Git, GitHub, pytest, Linux

AI Coding Tools: Claude Code, GitHub Copilot

EXPERIENCE

UTDesign

Aug 2026 – Present

Software Developer

Richardson, TX

- Serve as a point of contact with an industry sponsor, gathering requirements and presenting progress in bi-weekly demos for an AI-powered cybersecurity platform covering AI governance risk scoring, NLP-based policy compliance checking, and real-time security monitoring.
- Mapped the platform to customer compliance needs (NIST AI RMF, ISO/IEC 42001, SOC 2, ISO 27001, HIPAA), keeping framework rules in configurable YAML/JSON rubrics so requirements can change without rewriting the core engine.
- Coordinate with teammates in two-week agile sprints, delivering with Python, FastAPI, PostgreSQL, Redis, Docker, and GitHub Actions.

Rammarg, Inc.

May 2026 – Aug 2026

Software Development Intern

Palo Alto, CA

- Partnered directly with company leadership to turn business needs into system requirements and API designs, then built and deployed the resulting Python/FastAPI backend at ~200 ms response times with monitoring and alerting.
- Worked with scientists to understand their manual data workflow and replaced it with an end-to-end pipeline ingesting ~355K records into AWS-hosted PostgreSQL, saving each scientist ~6 hours per week.
- Identified cost drivers in an LLM inference service and cut operational costs by ~\$3.1K through batching and prompt compression without reducing throughput.
- Collaborated fully remotely with a small team, using pytest and GitHub Actions CI checks to catch regressions before deployment.

PROJECTS

[MirrorAPI](#) | HackUTD 2025 — 1st Place, State Farm Track

Nov 2025

- Built a tool that makes breaking API changes understandable to engineering teams: a deterministic JSON schema diff engine scores compatibility from 0 to 100 using Semantic Versioning-based risk weights.
- Integrated NVIDIA Nemotron to generate plain-language migration guidance, exposed through a versioned REST API and a React/TypeScript dashboard of risk levels and field-level diffs.

[Connect](#) | HackAI 2025 — 1st Place

Apr 2025

- Built an accessibility-focused communication platform that translates sign language in real time, using a React frontend, Flask backend, and WebRTC peer connections.
- Trained the sign language detection model on hand and arm landmarks with OpenCV, MediaPipe, and TensorFlow, and secured access with Google Firebase authentication.
